

Dear Sir or Madam,

I am applying for the Operations Officer position within ICC Dispute Resolution Services. The role strongly matches the direction I wish to give to my career: contributing to operational delivery, workflow coordination and reporting in an international environment, while using my data analysis skills to improve visibility, reliability and process efficiency.

My background combines economics, data analysis and operational support. I am particularly interested in roles where data is not treated as an isolated technical output, but as a tool to help teams prioritise, monitor activity, identify bottlenecks and improve service delivery. The responsibilities described in the position, including workflow monitoring, ticket follow-up, dashboard development, incident coordination and continuous improvement, correspond closely to the type of work I have progressively developed through my recent experience.

At Greenly, I worked as a Data Analyst and Climate Operations Intern in a fast-paced client-facing environment. I handled both my own client-related analyses and urgent internal requests from other analysts, which required prioritisation, responsiveness and clear follow-up. I used an internal ticketing and workflow tool, as well as Notion to document methods and share guidance with the team. This experience helped me develop a practical understanding of operational coordination: identifying urgent requests, ensuring data quality, communicating with colleagues, and producing reliable outputs under time constraints.

A key part of my work at Greenly involved structuring and validating heterogeneous datasets, setting up quality checks, detecting anomalies and preparing dashboards or analytical supports for non-technical stakeholders. Working with client-facing analyses also taught me the importance of data consistency, traceability and careful communication when outputs support service delivery. I also contributed to process improvements by creating templates and automated workflows in Python, Excel, Google Sheets and Google Apps Script, helping reduce manual work, standardise recurring analyses and make outputs easier to reuse by other analysts.

I have also worked in collaborative data projects with Data For Good, including a project with Reclaim Finance where I coordinated with data engineers and analysts to structure data pipelines, obtain additional data and produce robust analytical outputs. This strengthened my ability to work across technical and non-technical profiles, document processes, follow shared priorities and contribute to a transparent project workflow. I am comfortable working with Excel, SQL, Python, Power BI and documentation tools, and I am used to learning new internal systems quickly.

I understand that Case Connect is central to DRS's digital case management and operational continuity, by supporting communication, document sharing and coordination between parties, tribunals and ICC case teams. Although I would need to learn the detailed functioning of Case Connect and DRS internal processes, this learning curve is one of the aspects that motivates me. I would be keen to acquire in-depth knowledge of DRS practices and tools while contributing immediately through my strengths in operational follow-up, data quality, reporting, documentation and coordination.

I would also be motivated to support a service where operational reliability directly contributes to the quality, efficiency and continuity of international dispute resolution. By making operational activity easier to track, prioritise and resolve, I believe I could help strengthen backlog visibility, reduce recurrence of issues and support smooth collaboration between business and technical teams.

Fluent in both English and French, and strongly interested in international working environments through my studies and professional interests, I would be motivated to contribute to the DRS Operations team during this period of elevated delivery and process enhancement. I would bring a reliable, analytical and service-oriented approach, with the objective of supporting smooth operations, clear reporting and continuous improvement.

Yours faithfully,

Yannis Daguene
